

Guernsey Annual Population Bulletin

31st March 2011 - Issue date 21st March 2012

POLICY COUNCIL
THE STATES OF GUERNSEY

1.1 Introduction

This is the third edition of the Guernsey Annual Population Bulletin. It provides information on population headcounts, demographics and change, housing licences and projections. It is compiled using data provided by the States of Guernsey Social Security Department, Housing Department and the UK Government Actuary's Office. As far as possible international age groupings and classifications have been used to assist comparability with other jurisdictions.

1.2 Headlines

- At the end of March 2011, the Guernsey population was 62,915, which was 484 people (0.8%) higher than the previous year. The majority of the growth was due net migration, which contributed 382 people to the growth over the year. Natural increase contributed an additional 102 people.
- The number of live housing licences was 5,271* at the end of March 2011, compared to 5,068 at the same point in the previous year, an increase of 203 licences (4%).
- The median average age was 40 for males and 42 for females.
- The working age (16 to 64 years old) population increased by 334 people (0.8%) during the year ending March 2011, when it constituted 67.4% of the total population. The 0 to 15 years old age group decreased by 10 people (-0.1%) and the 65 and over age group increased by 160 people (1.6%) during the same period.
- The population over 85 years of age (classified as the "oldest old") increased by 29 people (2.0%).
- Based on recent historic trends the total population is projected to increase to approximately 70,000 by 2040, before levelling off.

* Including 324 licences issued to Waitrose fit-out staff and start-up teams working in the Island for a short period of time over 31st March 2012, see [page 4](#) for more information.

	Immigration	Emigration	Net migration
2008	5,622	5,179	443
2009	5,297	4,860	437
2010	4,482	4,468	14
2011	4,631	4,249	382

Figure 2.1.1: Annual changes in population number during years ending March 31st

Population headcounts have been calculated by the Social Security Department using administrative records since 2006.

Information on natural increase and net migration has also been available since the year ending March 2008.

The total population increased by 0.8% (484 people) to a total of 62,915 over the year ending 31st March 2011. See **Table 2.1.1**.

This annual increase was a result of a natural increase of 102 people and net migration of 382 people during the year.

Natural increase in population is defined as the number of births minus the number of deaths during a particular time period. The natural increase has been relatively stable over the four years ending 2011, see **Table 2.1.2** and **Figure 2.1.1**.

Net migration is the sum of immigration (people moving to the island) and emigration (people moving off the island). For statistical purposes, an immigrant is defined as a person moving to Guernsey to work for any period of time or live for a period of 26 weeks or more. An emigrant is defined as a person moving away from Guernsey to work for any period of time or live for a period of 26 weeks or more. Emigrants and immigrants include residentially qualified people; people with a housing licence and their families; and people living in open market accommodation.

As shown in **Table 2.1.3**, both immigration and emigration levels have generally decreased over the past four years. Net migration was comparatively low over the year ending March 2010, due to a larger reduction in immigration than emigration. However, net migration returned to a level more comparable with 2008 and 2009 in 2011.

With natural increase remaining relatively stable, the impact of changing net migration on the total population change can clearly be seen in **Figure 2.1.1**.

3.1 Annual demographics

Age and gender distribution pyramids, can be used to track changes in the population demographic over time. **Figure 3.1.1** provides a comparison of the distribution in 2006 compared to five years later, in 2011.

Changes in the overall population demographic tend to develop over relatively long periods of time. However, the 'bulge' in the pyramids due to the 'baby boom' (between 1946 and the 1960s) can be seen to be moving up out of the 35 to 39 group and into the 60 to 64 group. This bulge will move progressively further up the pyramid as the 'baby boom' generation get older.

The most prominent result of this is the visible change in the 60-64 age group, which increased in size by 1,206 people (or 40%) between 2006 and 2011.

It can also be seen that the number of males and females in all the age bands from sixty years upwards increased during the five year period ending in 2011.

Comparing the median age of the male and female populations gives an indication of the differences in the two demographic profiles. In March 2011, the median age (i.e. the age of the person in the middle if everyone was to be ranked in age order) was 40 for males and 42 for females.

The male population is higher than the female in almost all the age categories up to the age of 35 (see **Table 3.1.1**), as a result of there typically being slightly more baby boys born than girls. In almost all subsequent age categories the female population is higher than the male, due to the average life-span being longer for females than males.

Figure 3.1.1: Age and gender distribution (at 31st March)

Table 3.1.1: Age and gender distribution (at 31st March 2011)

	2006			2011		
	Female	Male	Total	Female	Male	Total

Finance	n/a	n/a	n/a	100	106	104
Other	491	379	683	335	331	260
Total	1,185	957	1,458	1,616	1,421	1,652*

* Includes 324 licences issued to Waitrose fit-out staff and start-up teams working in the Island for a short period of time, which coincided with the data snapshot date, following Waitrose's acquisition of two large stores in the Island.

NB At the time of producing the 2007 data there were some short-term licence applications which had not yet been processed by the Housing Department, and as such, the 2007 figures shown above are artificially low.

Table 4.1.3: Live housing licences (at 31st March) - Compassionate

	2006	2007	2008	2009	2010	2011
"En famille" or one to one	1,110	1,185	1,265	1,341	1,345	1,324
Other	581	655	725	672	683	691
Total	1,691	1,840	1,990	2,013	2,028	2,015

At present, the principal means of controlling population in Guernsey is through the administration of the Housing (Control of Occupation) (Guernsey) Law, 1994.

The Housing Department issues two main types of housing licences: (i) employment-related licences linked to a specific post of employment; (ii) non employment-related licences based on the length and strength of a person's connections with the Island.

All licences contain conditions relating to: (i) the local market accommodation the holder of the licence may occupy; and (ii) the duration of the licence.

Tables 4.1.1, 4.1.2 and **4.1.3** provide a summary of the number of licence holders (not including their spouse/partner or dependants) who were living in the Island by virtue of different types of housing licence as at 31st March for the years in question.

Tables 4.1.1 and **4.1.2** show the numbers of employment-related licence holders by employment sector. More detailed statistics are available from 2009 onward. It should be noted that the sector breakdown used from 2009 onward is not strictly comparable with earlier years (where available).

Table 4.1.3 shows the numbers of non employment-related or compassionate licence holders. These figures are unaffected by the economic sector code changes, so are comparable year on year.

It can be seen that the number of essential employment and compassionate licences have remained relatively stable between 2009 and 2011, following increases in numbers during earlier years.

The numbers of short term employment licences are more volatile and the impact of the live licences for Waitrose fit-out and start-up staff in March 2011 makes the trend less apparent. However, overall there appears to have been an upward trend between 2006 and 2009, followed by a levelling off in more recent years.

Please see the Housing Department report: **Summary of Right to Work Documents** for further information and detail on live licences.

5.1 Quarterly changes

The quarterly population changes result from a combination of natural increase and net migration (see [Figure 5.1.1](#)).

Net migration in Guernsey tends to be higher in the spring and summer quarters than in the autumn and winter, due to the seasonal nature of some areas of the Guernsey economy. Natural increase shows less seasonality.

The highest levels of natural increase (when there were 57 more births than deaths) observed over the four years ending 31st March 2011 were in the second quarter of 2008 and the third quarter of 2010. The lowest level of natural increase was in the first quarter of 2011 (15 more deaths than births during the quarter).

The highest level of net migration during the same period, was observed in the first quarter of 2008, when there were 744 more immigrants than emigrants. However, the lowest level had occurred in the quarter prior to that.

Figure 5.1.1: Quarterly population changes

Table 5.1.1: Quarterly population changes

		Births during quarter	Deaths during quarter	Natural increase during quarter	Immigration during quarter	Emigration during quarter	Net migration during quarter	Total population at end of quarter	Quarterly change in population number	Quarterly % change in population

	15 and under (%)	16 - 64 (%)	65 - 84 (%)	85 and over (%)	Total (%)
2007	17.0	67.1	13.8	2.2	100
2008	16.5	67.5	13.8	2.2	100
2009	16.4	67.5	13.8	2.3	100
2010	16.3	67.3	14.0	2.4	100
2011	16.1	67.4	14.1	2.4	100

NB - Categories may not sum to overall total due to rounding

Dependency ratios are used to indicate the portion of a population, which is economically dependent i.e. those who are eligible for retirement and those who are still in compulsory full time education (represented by the 15 and under and the 65 and over years of age categories).

The ratios (available from 2007 onward in **Table 6.1.1**) are calculated by dividing the number of individuals in the dependent age categories by the number of people in the working age category.

Trends in dependency ratios over time (and projected into the future) are used to assess the contribution rates required from the economically active in order to support the economically dependant.

In 2011, the overall dependency ratio was 0.48, which means that for every 100 people of working age (between the ages of 16 and 64) there were 48 people of dependant age.

The age groups presented in **Figure 6.1.1** and **Tables 6.1.2** and **6.1.3** are used to show the population of working age compared to those of dependant age.

The 85 and over category is used to highlight the number of "oldest old"; a portion of the population which is likely to be of particular interest when monitoring the ageing of a population.

Over the year ending March 2011, the number of people in the 16-64, 65-84 and 85 and over categories increased by 0.8%, 1.5% and 2.0% respectively. The number of children of 15 or under decreased by 0.1%.

The proportion of people in the dependent age categories was 32.6% in 2011, compared to 32.7% the previous year. However, with only five years worth of time series data available, it is not yet possible to gauge longer term trends.

7.1 Projections - best match model

Population projections are produced periodically by the UK Government Actuary's Department¹ (GAD) primarily for the purpose of actuarial review of the Guernsey Insurance Fund for the Social Security Department.

A range of projection models are produced by the actuaries to reflect different migration scenarios. The model presented here is the one which best matches recent historic data trends, so at present is taken to be the most likely in terms of future trends. It is based on a variety of assumptions including an average net migration of plus 200 people per annum. An alternative model (based on varying migration levels to achieve a constant population, as per States policy) is provided overleaf. For more information, please see the methodology section on [page 9](#).

This model (which was updated by GAD in 2011) projects the total population to increase gradually to about 70,000 in 2035 (see [Figure 7.1.1](#) and [Table 7.1.1](#)). This is primarily as a result of the ageing of the baby boom generation. The population is projected to then level off and decline from 2055 onwards (but at a slower rate than earlier increases since average life expectancy is projected to increase).

The age band 65 to 66 is shown on the graph, since between the years 2020 and 2032, the pension age will be gradually increased from 65 to 67.

The proportion of people under 15 is projected to fall from 16.3% of the total population in 2010 to 12.8% in 2070 (see [Table 7.1.2](#)). The proportion of people aged 16 to 64 is also projected to decrease (from 67.3% to 54.1%), whilst the number of people over 65 is projected to increase (from 16.4% to 33.1%).

The result (shown in [Table 7.1.3](#)) is a projected dependency ratio of 0.85 by 2070 (or 0.77 based on the upper limit of the working age group increasing to 66 years), compared to 0.48 in 2010.

¹ For more information see www.gad.gov.uk

2050	0.79
2060	0.85
2070	0.85

7.2 Projections - alternative model (constant population, varying migration)

The model shown in **Figure 7.2.1** and **Table 7.2.1** reflects how the demographics of the population is projected to change if the States successfully implements its policy to keep the total population stable. The model is based on a varying level of net migration, which achieves a constant total when combined with natural population changes.

The model uses negative net migration (i.e. more people moving off the Island than onto it) in the years from 2010 to around 2025. The effect is to counteract the population increases which are projected to result primarily from the ageing baby boom generation and increasing life expectancy.

The aging and death of the baby boom population “bulge”, combined with stable or reducing fertility rates is projected to result in natural population decreases from around 2050 onward. This model balances this with positive net migration (i.e. more people moving onto the Island than off it) towards the end of the projection period.

In this model, the proportion of people under 15 is projected to fall from 16.3% of the total population in 2010 to 13.0% in 2070 (see **Table 7.2.2**). The proportion of people aged 16 to 64 is also projected to decrease (from 67.3% to 57.1%), whilst the number of people over 65 is projected to increase (from 16.4% to 29.8%).

The result (shown in **Table 7.2.3**) is a projected dependency ratio of 0.86 by 2050, reducing to 0.75 by 2070 (or 0.85 and 0.74 respectively based on the upper limit of the working age group increasing to 66 years), compared to 0.48 in 2010.

NB - The age band 65 to 66 is shown on the graph, since between the years 2020 and 2032, the pension age will be gradually increased from 65 to 67.

Figure 7.2.1: Projected population by age group

Table 7.2.1: Projected population by age group

	15 and under	16 - 64	65 - 84	85 and over	Total
2020	9,635	37,513	11,802	2,225	61,175
2030	8,683	34,471	14,828	3,194	61,175
2040	7,755	33,015	15,389	5,016	61,175
2050	8,024	32,869	13,873	6,409	61,175
2060	8,160	33,538	12,649	6,828	61,175
2070	7,982	34,956	11,822	6,415	61,175

Table 7.2.2: Projected percentage of population by age group

	15 and under (%)	16 - 64 (%)	65 - 84 (%)	85 and over (%)	Total (%)
2020	15.7	61.3	19.3	3.6	100
2030	14.2	56.3	24.2	5.2	100
2040	12.7	54.0	25.2	8.2	100
2050	13.1	53.7	22.7	10.5	100
2060	13.3	54.8	20.7	11.2	100
2070	13.0	57.1	19.3	10.5	100

Table 7.2.3: Projected dependency ratios

	Dependency ratio
2020	0.63
2030	0.77
2040	0.85
2050	0.86
2060	0.82
2070	0.75

8.1 Methodology and further information

Headcounts

Population headcounts are calculated by the Social Security Department using administrative records. All individuals who are employed in Guernsey or who are resident for longer than 26 weeks are required to register with the Department. The data is cross referenced with information provided by the Education Department in order to calculate a headcount at the end of each quarter.

This data has been available on an annual basis since March 2006 and quarterly since March 2007.

Prior to this, population figures were calculated using data collected by census every 5 or ten years; the last census was held in 2001. However, due to the different method and count date; the figures produced by the two methodologies are not directly comparable.

Following a States decision (see *Billet d'Etat XVII, 2010*, available via www.gov.gg/billets), a census was not held in Guernsey in 2011. The Policy and Research Unit are instead working on developing an electronic alternative, which will utilise existing administrative sources. The intention is to expand upon the information already published in this bulletin in order to provide more of the information traditionally collected via a census, such as population by parish.

New information on the Island's housing stock, including household tenures and distribution by parish is available in the *Guernsey Annual Housing Stock Bulletin*, via www.gov.gg/property.

Projections

Population projections are provided periodically by the UK Government Actuary's Department (GAD) primarily for the purpose of actuarial review of the Guernsey Insurance Fund for the Social Security Department. A range of projection models are produced by the actuaries to reflect different migration scenarios. They also use a range of other assumptions in their calculations e.g. fertility and mortality rates.

Each year the Policy and Research Unit assesses which of the models offers the best match in light of any changes to actual data trends or circumstances, including changes to States policy or legislation which will affect the population level (for example, changes to immigration controls).

This year (as per last two years), the model based on a migration scenario of plus 200 net per annum best matched recent historic data trends, so is taken to be the most likely in terms of future trends. The projected population numbers presented are the same as those presented last year, in line with GAD's latest models.

In addition, the constant population model provided by GAD is included to show how the demographics are projected to change if the States achieves its policy to maintain a constant population by varying levels of migration.
